

Introducing The Multistacker

The simple and cost effective solution for high-rise buildings or unit complexes

Designed for apartment living, multistacker technology makes time consuming and expensive installs a thing of the past.

The multistacker uses existing cabling and infrastructure to deliver Foxtel signal to each unit inside your building.

How it works

1. Device is installed between the new or existing satellite dish
2. A signal is then sent over the existing cables to every unit in the building
3. Any unit can then have their own Foxtel IQ3 set top box installed

Multistacker technology provides a significant saving compared to previous quotes for different infrastructure solutions.
